Laboratoryreport

Final Report, page 1 / 1

Sample Material: Saliva

	Result	Unit	Initial Result	Norm
Endokrinologie				
Melatonin in saliva (8pm)	1,3	pg/ml		
Melatonin in saliva (midnight)	1,7	pg/ml		
Melatonin in saliva (2am)	3,9	pg/ml		

The melatonin value in sputum steadily rises towards night time and reaches its peak after midnight. Physiologically unremarkable values of approximately 5 pg/ml are found during the day and approximately 10 pg/ml in the evening and at night. For an optimal day-night rhythm, the values should be above 20 pg/ml after midnight.

Yours sincerely medically validated by Hauke Stöter
